The aim of education is to develop human faculties. We are empowered with enormous intelligence and physical abilities that enable us to adapt to change as the situation may demand. Science is the foundation of the success that we have achieved. While scientific processes and applications have brought about technological revolution, scientific attitude and temper have shaped the personality of the mankind. But of late the interest of students opting for science has declined. This could be due to various reasons both administrative and managerial. In spite of the constraints, science dominates over other faculties. Given a right perspective, science students, approach a problem in an organized, disciplined manner, are open to suggestions, conclude only after experimentation and demonstrate tolerance. These are the qualities that go a long way in shaping personalities. Interest in science education begins at home for the pre - school children, and grows in school - college. It is the duty of the teachers to keep the subject alive and given the right environment, this can be achieved. Teaching science using live models, specimens, charts, other AV aids like films, videos make learning easy. Science can best be learnt by doing project work at all levels. Science exhibitions, competitions, seminars are like the icing on the cake - that add a lot of enthusiasm and interest among students. With this background we are organizing 7th State Level Competition for oral and poster presentation in science subjects, **Science Excellence**.
